

# Dohyun Chung

Support Engineer · Integration Debugging & Engineering Collaboration · Bilingual KR/EN

leahchung99@gmail.com | New York, NY · Relocating to Seoul | Portfolio | LinkedIn

## SUMMARY

Bilingual (Korean/English) software engineer with 3+ years specializing in integration debugging and technical support — reproducing reported issues by testing APIs directly, tracing failures through logs and pipelines, and translating findings into precise bug reports engineering can act on. Comfortable reading code to understand where a sync breaks, and takes full ownership of issues until they are resolved and documented.

## EXPERIENCE

### Software Engineer & Technical Support Lead

Apr 2024 – Present

Kiss Products, Inc. — New York, NY

- Diagnosed intermittent Sales Platform slowdowns by analyzing server logs and database query patterns in SQL — identified an order confirmation cron job queue consistently hitting capacity and timing out. Adjusted processing limits and queue logic, fully resolving the issue.
- Debugged and maintained the SAP ↔ Sales Platform data pipeline: traced sync failures end-to-end, cleared record backlogs, and added observability checkpoints to surface future issues proactively.
- Diagnosed a merchant-reported data visibility issue on KRS POS — records visible one day, gone the next — by tracing it to a UTC timezone hardcoded across multiple back-office pages. Shipped a full cross-page fix and documented the pattern for the engineering team.
- Debugged recurring OAuth authentication failures on the Sales Platform API — identified 403 scope errors and token expiry as the primary root causes of daily access complaints, resolved each by correcting grant configurations and permission scopes.
- Built an automated monitoring bot for the Sales Platform that reads AWS server logs and database state, synthesizes anomalies into structured alerts, and delivers them to the team via messaging — enabling proactive issue detection before customers report them.
- Primary technical contact for external merchant customers on KRS POS: reproduce reported issues by testing API endpoints directly, distinguish system failures from configuration and UX problems, and translate findings into clear engineering escalations with reproduction steps.
- Authored internal documentation including incident post-mortems, Sales Platform FAQ, and KRS POS onboarding guides — creating reusable references that reduced repeated support requests and accelerated new-hire ramp-up.

### Software Engineer & Technical Support

May 2023 – Apr 2024

24/7 Teach — New York, NY

- Technical liaison between 3,000+ end users and the engineering team — reproduced ambiguous behavior, traced issues to root cause, and translated findings into precise bug reports with reproduction steps that engineering could act on without further context-gathering.
- Identified recurring failure patterns across the platform; built an internal knowledge base of failure modes, workarounds, and escalation criteria that shortened investigation time for the entire team.

## EDUCATION

### B.A. in Computer Science & Sociology

Dec 2023

New York University
