

Dohyun Chung

Technical Support Engineer · Observability & Integration Debugging · Bilingual KR/EN

leahchung99@gmail.com | New York, NY · Relocating to Seoul | Portfolio | LinkedIn

SUMMARY

Bilingual (Korean/English) engineer with 3+ years reproducing and resolving integration and API issues — analyzing logs and code to trace root causes, debugging data pipelines end-to-end, and building observability tooling to surface anomalies before customers report them. Defaults to a client-centric approach: owns issues through to resolution, documents patterns in knowledge bases, and translates complex findings clearly for both technical and non-technical audiences.

EXPERIENCE

Software Engineer & Technical Support Lead

Apr 2024 – Present

Kiss Products, Inc. — New York, NY

- Built an automated observability tool for the Sales Platform — reads AWS server logs, metrics, and database state in real time, synthesizes anomalies into structured alerts, and routes them to the team proactively. Shifted support from reactive to proactive by surfacing issues before customers reported them.
- Diagnosed customer-reported performance degradation on the Sales Platform by analyzing server logs and SQL query patterns — traced the root cause to an order confirmation cron job hitting queue capacity and timing out. Adjusted batch limits and queue logic to fully restore platform reliability.
- Debugged the SAP ↔ Sales Platform integration end-to-end — traced data sync failures through logs, cleared record backlogs, and added observability checkpoints so issues surface before they impact business operations.
- Diagnosed recurring OAuth API failures — reproduced 403 scope errors and token expiry issues by testing the authorization flow directly, identified misconfigured permission grants as the root cause, and resolved daily customer access complaints across the platform.
- Reproduced a merchant-reported data visibility issue on KRS POS — records visible one day, gone the next — by tracing it to a UTC offset hardcoded across multiple back-office pages. Shipped a full cross-page fix and documented the pattern for the engineering team.
- Primary technical contact for external merchant customers on KRS POS — led product demonstrations for new merchant partners, reproduced reported issues by testing API endpoints directly, distinguished system failures from configuration problems, and translated findings into engineering escalations with reproduction steps.
- Maintained a technical knowledge base including incident post-mortems, integration FAQ, and KRS POS onboarding guides — enabling the broader team to resolve common issues independently and reducing repeated support requests.

Software Engineer & Technical Support

May 2023 – Apr 2024

24/7 Teach — New York, NY

- Technical liaison between 3,000+ end users and the engineering team — reproduced ambiguous behavior, traced issues to root cause, and translated findings into precise bug reports with reproduction steps that engineering could act on without further context-gathering.
- Identified recurring failure patterns across the platform; built an internal knowledge base of failure modes, workarounds, and escalation criteria that shortened investigation time for the entire team.

EDUCATION

B.A. in Computer Science & Sociology

Dec 2023

New York University

SKILLS

Languages	Korean (Native) · English (Fluent)
Observability	Log Analysis · Monitoring & Alerting · Root-Cause Analysis · Anomaly Detection · AWS CloudWatch
Integrations	REST APIs · Webhooks · OAuth Debugging · SAP IDoc · Odoo · Data Pipeline Debugging · HTTP/API Debugging
Technical	Python · JavaScript/TypeScript · SQL · Linux · Bash Scripting · AWS · Git
Communication	Technical Writing · Bug Reproduction · Engineering Escalation · Product Demos · Cross-functional Collaboration
